Working Papers

The Local Reaction to Unauthorized Mexican Migration to the US (*Job Market Paper*, with Kara Ross Camarena) [[Link](#)]

We study the political impacts of unauthorized Mexican migration to the United States. We exploit exogenous variation in Mexican municipalities and migrant networks from data on over 7 million likely unauthorized migrants who obtained consular IDs. We find evidence of conservative electoral and policy responses. Unauthorized migration significantly increases the vote share of the Republican Party in federal elections, decreases spending on education, and increases relative spending on policing and on the administration of justice. We show that migrants have modest economic distributional effects. They raise poverty and decrease employment in “migrant intensive” sectors. They also increase out-migration and heighten in-group values among US natives. By contrast, unauthorized migrants have no discernible impact on wages or unemployment. Despite prompting investment in policing and courts, migrants do not impact crime, but they increase police use of deportation programs. Together, our findings suggest that narrow economic losses, underlying population changes, and shifts in values account for some of the observed political responses. These commonly discussed do not fully explain our findings.

Shocks at Destination and Households' Supply of Migrants (with Horacio Larreguy, Gustavo Fajardo and Emilio Gutiérrez)

We study how unemployment shocks in the United States affect Mexican households' decisions. We emphasize households at origin (as opposed to individuals) as the decision-making units for migration decisions. We show that negative changes in US labor conditions, which are diffused by household members at destination to those at origin, lead to heterogeneous migration responses by Mexican households that have members abroad. We argue that this heterogeneous response is driven by the relative magnitudes of income (proxied by education) and substitution effects after a negative employment shock in the United States. These results also inform the literature on selection patterns in international migration, which suggests a new channel through which negative shocks in the host economy negatively affect the skill composition of subsequent migrants.
